

# Exponential Rules

$$a^m \times a^n = a^{m+n}$$

$$\underline{\text{Ex}} \quad x^2 \times x^4 = x^{2+4} = x^6$$

like bases when multiplied you add exponents

$$\begin{array}{c} \boxed{a} \\ \times \\ \boxed{a} \end{array} = \boxed{a} \quad (m + n)$$

$$\frac{a^m}{a^n} = a^{m-n}$$

$$\underline{\text{Ex}} \quad \frac{x^4}{x^2} = x^{4-2} = x^2$$

like bases when divided you subtract exponents

$$\frac{\boxed{a}^m}{\boxed{a}^n} = \boxed{a}^{m-n}$$

$$\underline{\text{Ex}} \quad a$$

$$(a^m)^n = a^{m \times n}$$

exponent to exponent you multiply

$$(\boxed{a}^m)^n = \boxed{a}^{m \times n}$$

$$(a \times b)^m = a^m \times b^m$$

$$\underline{\text{Ex}} \quad (x \times y)^2 = x^2 \times y^2$$

each base raise the power

$$(\boxed{a} \times \boxed{b})^m = \boxed{a}^m \times \boxed{b}^m$$

$$\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}$$

Ex)  $\left(\frac{x}{y}\right)^3 = \frac{x^3}{y^3}$

break it - raise numerator  
raise denominator

$$\left(\frac{\square}{\square}\right)^{\square} = \frac{\square^{\square}}{\square^{\square}}$$

$$a^{(-m)} = \frac{1}{a^m}$$

Ex)  $2^{(-x)} = \frac{1}{2^x}$

cannot have negative exponents

$$\square^{-\square} = \frac{1}{\square^{\square}}$$

$$a^{\frac{1}{m}} = \sqrt[m]{a}$$

Ex)  $x^{\frac{1}{4}} = \sqrt[4]{x}$

1 over index becomes root to that index

$$\square^{\frac{1}{\square}} = \sqrt[\square]{\square}$$
